

This project is a combination of the skills we learn over the course using classes, accessor and mutators. The hurdles we ran across was determining if the Subcontractor class need any mutators, and class inheritance from Contractor to Subcontractor but it lead us down rabbit holes that gave us the ability to make our code cleaner using format specifiers in our outputs and using this keywords when using same variable like Contractor on “startDate”. We did have extra time so we removed start date and replaced it with start time and end time to reflect a more modern timecard with automatically being able to tell if a night shift differential need to be applied based on the time worked (military time) in the file “Final_modified.cs”.
